Top 5 Cities by Revenue

Total Revenue by Month

Revenue by Category

Insights:

- **Confections & Meat** are the top 2 revenue-driving categories, collectively accounting for **~24%** of total revenue
- Revenue **peaked in Jan & Mar 2018**, with a **sharp drop in May** — due to incomplete data for the month
- **Tucson** leads in revenue but **Jackson** shows slightly lower transaction count — suggesting **higher AOV per transaction**, a potential upsell model worth exploring for other cities
- **AOV of \$641** with an **average basket size of 13 items** indicates customers tend to make **mid-sized, multi-item purchases**

⚠️ Note: This dataset contains transaction-level quantity and price data only. Profitability and margin analysis require cost/COGS data, and revenue targets and industry benchmarks are not available — analysis is based on internal trends only.

Total Revenue by Category

Revenue & Sales Volume by Product Class

Insights:

- Revenue and quantity are **strongly correlated** across all products, suggesting a **uniform pricing strategy** with no significant margin outliers
- **Bread - Calabrese Baguette** leads revenue by a narrow margin over Shrimp - 31/40 — **no single dominant SKU**, indicating low concentration risk
- 3 bottom products (Apricots, Bread Crumbs, Pastry) show **\$0 revenue** despite recorded transactions — likely **promotional/bundled items** warranting a pricing strategy review
- **High class** leads revenue while **Low class** shows disproportionately high volume relative to revenue — low-margin items may be **diluting overall basket value**

Total Customers
98.759K

Avg Lifetime Spend per Customer
\$43.88K

Avg Purchase Frequency
68.43

Dataset period: Jan–May 2018

Customers in Mid-Frequency Segment
Indicating strong habitual purchasing behavior across the customer base

96.30%

Customer Distribution by Spend Segment

Customer Segmentation Overview by Spend Level

Insights:

- **69%** of customers fall in the **Mid spend segment** (\$20K–\$80K), with only **8.77%** classified as High spenders — significant upside potential for upselling
- **High spend customers** drive disproportionate revenue despite being the smallest group — a classic **80/20 pattern**. Retention and loyalty programs should be the first lever before acquiring new customers
- Near-absence of **Low-frequency buyers (3.7%)** suggests a largely **habitual customer base** — growth requires converting Mid spenders upward, not reactivating dormant ones
- **\$43.88K lifetime spend** with **68 purchases/customer** indicates stable, recurring behavior — well-suited for **cross-sell and basket-expansion**, not acquisition-heavy campaigns

Total Employee
23

Avg Transactions processed
293.83K

Avg Revenue per Employee
\$188.42M

Insights:

- All 23 employees perform within a very narrow revenue band — top vs bottom performers differ by **less than 10%**, indicating a highly standardized sales process with equitable order distribution
- Monthly revenue trend is near-identical across all employees, moving in lockstep — peaks in months 1 & 3, dip in month 2, sharp drop in month 5 (*incomplete data*). This uniformity suggests revenue fluctuation is driven by external/seasonal factors rather than individual performance differences.
- With avg revenue of \$188M per employee, the team is highly productive — HR should prioritize **retention over performance improvement initiatives**, as the bottleneck is likely external demand rather than individual capability.
- The <2% revenue gap between top and bottom performers indicates no meaningful outliers — rather than ranking employees, leadership should focus on **team-level incentives and seasonal demand planning** to sustain this consistency.
